

MCP Confluent Cloud

An Model Context Protocol (MCP) server, acts as a standardized way for AI models to securely access and interact with external data and tools, such as files, databases, and APIs. This allows Large Language Models (LLMs) to provide up-to-date, real-world information instead of relying solely on their training data. It functions as a universal adapter that enables AI applications to retrieve live context and perform actions in a secure and consistent manner.
